HCDE 310 Final Project - Run Check

From start to finish Run Check always remains the same, a simple, straight forward app that grants the user direct access to real time information about the weather outside. The app was designed for outdoor athletes, outdoor commuters but also in general, anyone that wants to go outside. As most current applications shower the user in unnecessarily extra information that isn't really used or looked at by its users, Run Check avoids the hassle and streamlines what is important directly to the user.

Creating the application from start to finish was a super fun task, as I was able to set the rules for myself and go crazy with how I wanted to execute the application process. I was able to pour in everything I learned from HCDE 310, from the front end to the backend, my skills shined brightly throughout the whole process. My endless hours of debugging and google searching also taught me how to be self sufficient and a strong scholar that is able to go online, gain strong new skills and identify problems in a heartbeat. These skills aren't shown through the application but were applied and gained from my experience in this class. My quirkiness of neet tricks, quick fix solutions, and intense google search and self learning made this whole process a huge success.

Thank you for the fantastic learning experience in HCDE 310!
